Election/Restrictions

Restriction is required under 35 U.S.C. 121 and 372.

This application contains the following inventions or groups of inventions which are not so linked as to form a single general inventive concept under PCT Rule 13.1.

In accordance with 37 CFR 1.499, applicant is required, in reply to this action, to elect a single invention to which the claims must be restricted.

The Markush group set forth in the claims includes both independent and distinct inventions, and patentably distinct molecules (or species) within each invention. However, this application discloses and claims a plurality of patentably distinct inventions far too numerous to list individually. Moreover, each of these inventions contains a plurality of patentably distinct molecules, also far too numerous to list individually. For these reasons provided below, restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 1-25, drawn to a method of producing a layer of a sol-gel on a substrate using one of various molecules with the structural formulae described in claim 8 and their compositions, classified in for example class 436 subclass 170. A further election of a single disclosed species will be required if this Group is elected.
- II. Claims 26-30, drawn to a device with an immobilized sol gel biomolecule, classified in Class 422 subclass 79.

The inventions listed as Groups I and II lack unity of invention because even though the inventions of these groups require the technical feature of producing a layer of sol-gel on a substrate, this technical feature is not a special technical feature as it does not make a contribution over the prior art in view of Zare et al. US Patent 6884346.

Art Unit: 1797

Zare et al. teaches a separation column and a method of making a sol-gel separation column. The separation column includes a separation channel and a separation medium in the channel. The separation medium includes a porous matrix, and the porous matrix includes a support and a stationary phase. The support includes a metal organic polymer, such as a photopolymer, and the stationary phase includes a bonded phase. The separation medium can be used to separate a sample of analytes.

The shared technical feature of Groups I and II above is therefore not a special technical feature as it does not make a contribution over the prior art.

The inventions are distinct, each from the other because of the following reasons:

1. Inventions I and II are related as product and process of use. The inventions can be shown to be distinct if either or both of the following can be shown: (1) the process for using the product as claimed can be practiced with another materially different product or (2) the product as claimed can be used in a materially different process of using that product. See MPEP § 806.05(h). In the instant case the method of group I could be practiced to make a device other than the one claimed in instant group II, such as the coated substrate that is a column in the aforementioned US Patent 6884346.

In addition to an election of one of the above Groups, restriction is further required under 35 U.S.C. 121 as follows:

2. In accordance with the decisions in *In re Harnisch*, 631 F.2d 716, 206 USPQ 300 (CCPA 1980); and *Ex parte Hozumi*, 3 USPQ2d 1059 (Bd. Pat. App. & Int. 1984), restriction of a Markush group is proper where the molecules within the group either (1) do not share a common utility, or (2) do not share a substantial structural feature disclosed as being essential to that utility. In addition, a Markush group may encompass a plurality of independent and distinct inventions where two or more members are so unrelated and diverse that a prior art reference

Art Unit: 1797

anticipating the claim with respect to one of the members would not render the other members obvious under 35 U.S.C. 103.

3. Where an election of Groups I is made, an election of a single disclosed molecule (in the claims and specification) is further required, including an exact definition of each substituent on the base molecule (listed in claim 8), wherein a single member at each substituent group or moiety is selected. For example, the base molecule has the substituent group R₆ wherein R₆ is recited to be selected from the group consisting of C₁ –C₃ alkyl such that applicant must select a single substituent for R₂, and each subsequent variable position such as the one for R₁-R₉, etc. In the instant case, the Office will review the claims and disclosure to determine the scope of the independent invention encompassing the elected molecule (molecules which are so similar thereto as to be within the same inventive concept and reduction to practice). The scope of an independent invention will encompass all molecules within the scope of the claim that fall into the same class and subclass as the elected molecule (or set of molecules). Examination will then proceed on the elected molecule AND the entire scope of the invention encompassing the elected species, as defined by the above Groups and common classification. A clear statement of the examined invention, defined by those class(es) and subclass(es) will be set forth in the first action on the merits. Note that the restriction requirement will not be made final until such time as applicant is informed of the full scope of molecules along with (if appropriate) the process of using or making said molecules under examination. This will be set forth by reference to specific class(es) and subclass(es) examined. Should applicant traverse on the ground that the molecules are not patentable distinct, applicant should submit evidence now of record showing the molecules to be obvious variants or clearly admit on the record that this is the case. In either

Art Unit: 1797

instance, if the examiner finds one of the inventions unpatentable over the prior art, the evidence or admission may be used in a rejection under 35 U.S.C. 103(a) of the other.

All molecules falling outside the class(es) and subclass(es) of the selected molecule and other molecules encompassed by the elected Group above will be directed to nonelected subject matter and will be withdrawn from consideration under 35 U.S.C. 121 and 37 C.F.R. 1.142(b). Applicant may reserve the right to file divisional applications on the remaining subject matter. (The provisions of 35 U.S.C. 121 apply with regard to double patenting covering divisional applications).

- 4. Applicant is reminded that upon cancellation of claims to a non-elected invention, the inventors must be amended in compliance with 37 CFR 1.48(b) if one of the currently named inventors is no loner an inventor of at least one claims remaining in the application. Any amendment of inventorship must be accompanied by a petition under 37 DFR 1.48)b) and by the fell required under 37 DFR 1.17)I).
- 5. Markush claims must be provided with support in the disclosure for each member of the Markush group. See MPEP 608.01(p). Applicant should exercise caution in making a selection of a single member for each substituent group on the base molecule to be consistent with the written description.

Rationale Establishing Patentable Distinctiveness Within Each Group

6. Group I listed above is directed to or involves the use of molecules which are recognized in the art as being distinct from one another because of their diverse chemical structure, their different chemical properties, modes of action, different effects and reactive conditions (MPEP 806.04, MPEP 808.01). Additionally, the level of skill in the art is not such that one invention

Application/Control Number: 10/540,730

Art Unit: 1797

would be obvious over either of the other inventions (Groups), i.e. they are patentable over each other. Chemical structures that are similar are presumed to function similarly, whereas chemical that are not similar are not presumed to function similarly. The presumption even for similar chemical structures though is not irrefutable, but may be overcome by scientific reasoning or evidence showing that the structure of the prior art would not have been expected to function as the structure of the claimed invention. Note that in accordance with the holdings of **Applications of Papesch**, 50 CCPA 1084, 315 F.2d 381, 137 USPQ 43 (CCPA 1963) and **In re Lalu**, 223 USPQ 1257 (Fed. Cir, 1984), chemical structures are patentably distinct where the structures are either not structurally similar, or the prior art fails to suggest a function of a

Page 6

7. Applicant is advised that the reply to this requirement to be complete must include (i) an election of a species or invention to be examined even though the requirement may be traversed (37 CFR 1.143) and (ii) identification of the claims encompassing the elected invention.

claimed molecule would have been expected from a similar structure.

The election of an invention or species may be made with or without traverse. To preserve a right to petition, the election must be made with traverse. If the reply does not distinctly and specifically point out supposed errors in the restriction requirement, the election shall be treated as an election without traverse.

8. Applicant is reminded that upon the cancellation of claims to a non-elected invention, the inventorship must be amended in compliance with 37 CFR 1.48(b) if one or more of the currently named inventors is no longer an inventor of at least one claim remaining in the application. Any amendment of inventorship must be accompanied by a request under 37 CFR 1.48(b) and by the fee required under 37 CFR 1.17(i).

9. The examiner has required restriction between product and process claims. Where applicant elects claims directed to the product, and the product claims are subsequently found allowable, withdrawn process claims that depend from or otherwise require all the limitations of the allowable product claim will be considered for rejoinder. <u>All</u> claims directed to a nonelected process invention must require all the limitations of an allowable product claim for that process invention to be rejoined.

In the event of rejoinder, the requirement for restriction between the product claims and the rejoined process claims will be withdrawn, and the rejoined process claims will be fully examined for patentability in accordance with 37 CFR 1.104. Thus, to be allowable, the rejoined claims must meet all criteria for patentability including the requirements of 35 U.S.C. 101, 102, 103 and 112. Until all claims to the elected product are found allowable, an otherwise proper restriction requirement between product claims and process claims may be maintained.

Withdrawn process claims that are not commensurate in scope with an allowable product claim will not be rejoined. See MPEP § 821.04(b). Additionally, in order to retain the right to rejoinder in accordance with the above policy, applicant is advised that the process claims should be amended during prosecution to require the limitations of the product claims. Failure to do so may result in a loss of the right to rejoinder. Further, note that the prohibition against double patenting rejections of 35 U.S.C. 121 does not apply where the restriction requirement is withdrawn by the examiner before the patent issues. See MPEP § 804.01.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Sally A. Sakelaris whose telephone number is 5712726297. The examiner can normally be reached on Monday-Friday 8-5:00.

Application/Control Number: 10/540,730 Page 8
